

Linear Regression with independent data

Consider the usual regression model

$$y_i = X_i' \beta + u_i$$

$\underset{n \times 1}{\text{L}}$ $\underset{n \times K}{\text{L}}$ $\underset{K \times 1}{\text{L}}$ $\underset{1 \times 1}{\text{L}}$

Identification

$$(i) E X_i u_i = 0$$

$$(ii) E X_i X_i' \text{ has full rank } K.$$

Then

$$E X_i (y_i - X_i' \beta) = 0$$

$$\Rightarrow E X_i y_i = E X_i X_i' \beta$$

$$\Rightarrow \beta = (E X_i X_i')^{-1} E X_i y_i$$

The proposed estimator is the sample analogue :

$$\hat{\beta}_n = \left(\frac{1}{n} \sum_{i=1}^n X_i X_i' \right)^{-1} \frac{1}{n} \sum_{i=1}^n X_i y_i$$

Asymptotic Theory

Lemma 1 :- (from Portmanteau Theorem) Convergence in distribution of random vectors in \mathbb{R}^K , $X_n \xrightarrow{d} X$, is equivalent to

$$\lim_{n \rightarrow \infty} E h(X_n) = E h(X) \quad \text{for every continuous functional } h(\cdot).$$

(Intuition : CDF converge if all the moments converge)

Lemma 2 :- a) (Monotone Convergence) If $X_n \geq 0$, monotonic and for each $w \in \Omega$, $\lim_{n \rightarrow \infty} X_n(w) = X(w)$. Then

$$\lim_{n \rightarrow \infty} E X_n = E X$$

b) (Fatou's Lemma) If $X_n \geq 0$, then

$$E (\liminf_{n \rightarrow \infty} X_n) \leq \liminf_{n \rightarrow \infty} E X_n$$

c) (Dominated Convergence) Suppose that for each $w \in \Omega$,
 $\lim_{n \rightarrow \infty} X_n = X$. Furthermore, there is some Y such that
 $E Y < \infty$ and $|X_n| \leq Y$ for each $n \geq 1$. Then

$$\lim_{n \rightarrow \infty} E X_n = E X$$

Lemma 3. - We say

$$X_n \xrightarrow{d} X \iff \text{for all open } G \subset \mathbb{R}^d, \quad \liminf_{n \rightarrow \infty} P\{X_n \in G\} \geq P\{X \in G\}$$

proof: Consider sufficiency first. We assume that B holds. Then take some continuous function $f(\cdot)$ and write

$$\begin{aligned} E f(X) &= \int_0^\infty P\{f(X) > t\} dt \\ &\stackrel{\text{by B}}{\leq} \int_0^\infty \liminf_{n \rightarrow \infty} P\{f(X_n) > t\} dt \\ &\stackrel{\text{Fatou's Lemma}}{=} \liminf_{n \rightarrow \infty} \int_0^\infty P\{f(X_n) > t\} dt \\ &= \liminf_{n \rightarrow \infty} E f(X_n) \end{aligned}$$

Now take some bounded continuous function $h(\cdot)$ such that $|h| \leq c < \infty$. This requires that $c + h(\cdot) \geq 0$ and $c - h(\cdot) \geq 0$. Then

$$\therefore c + E h(X) \leq c + \liminf_{n \rightarrow \infty} E(X_n)$$

$$\Rightarrow E h(X) \leq \liminf_{n \rightarrow \infty} E(X_n)$$

$$\therefore c - E h(X) \leq c - \liminf_{n \rightarrow \infty} E(X_n)$$

$$\Rightarrow E h(X) \geq \limsup_{n \rightarrow \infty} E(X_n)$$

So we conclude that $\lim_{n \rightarrow \infty} E h(X_n) = E h(X)$. By Lemma 2 our result follows.

For necessity take a continuous nonnegative $f_j(x) \leq \mathbb{1}_{\{x \in G\}}$ such that $f_j(\cdot) \rightarrow \mathbb{1}_{\{\cdot \in G\}}$ as $j \rightarrow \infty$. Then the result follows from Fatou's Lemma. ■

Theorem 2. - (Continuous Mapping) Let $\{x_n\}$ be a sequence of random vectors in \mathbb{R}^d such that $x_n \xrightarrow{P} x$. Also, let $g(\cdot)$ be an \mathbb{R}^k -valued function on \mathbb{R}^d that is continuous on a set C such that $P\{x \in C\} = 1$ (i.e. almost everywhere). Then

$$g(x_n) \xrightarrow{P} g(x) \quad \text{as } n \rightarrow \infty.$$

proof: Assume $x_n \xrightarrow{P} x$. We want to show $P\{g(x) \in G\} \leq \liminf_{n \rightarrow \infty} P\{g(x_n) \in G\}$ where G is an open set in \mathbb{R}^d .

Suppose $g^{-1}(G) \cap C$ is empty. Then

$$\begin{aligned} P\{g(x) \in G\} &= P[\{g(x) \in G\} \cap \{x \in C\}] \\ &= P[x \in g^{-1}(G) \cap C] = 0 \\ &\leq \liminf_{n \rightarrow \infty} P\{g(x_n) \in G\} \text{ is trivially true.} \end{aligned}$$

Suppose $g^{-1}(G) \cap C$ is non-empty. Then choose a point $v \in g^{-1}(G) \cap C$. There must be an open ball N_v such that $g(w) \in G$ for all $w \in N_v$. This means that $N_v \subset g^{-1}(G)$. Thus $g^{-1}(G) \cap C = g^{-1}(G)^\circ$

Using this result we write

interior of
 $g^{-1}(G)$

$$\begin{aligned} P\{x \in g^{-1}(G)\} &= P\{x \in g^{-1}(G) \cap C\} \\ &\leq P\{x \in g^{-1}(G)^\circ\} \\ &\leq \liminf_{n \rightarrow \infty} P\{x_n \in g^{-1}(G)^\circ\} \\ &\leq \liminf_{n \rightarrow \infty} P\{x_n \in g^{-1}(G)\}. \end{aligned}$$

because
 $x_n \xrightarrow{P} x$

by Lemma 1, the result follows.

Lemma 4. - (Slutsky's Theorem) Suppose that a sequence of random vectors $x_n \xrightarrow{P} x$ and let $h(\cdot)$ be continuous almost everywhere. Then

$$h(x_n) \xrightarrow{P} h(x).$$

proof: We want to show that $\limsup_{n \rightarrow \infty} P\{|h(x_n) - h(x)| > \epsilon\} = 0$. Write

$$\begin{aligned} P(|h(x_n) - h(x)| > \epsilon) &= P(|h(x_n) - h(x)| > \epsilon, \|x_n - x\| \geq \delta_\epsilon) + \\ &\quad P(|h(x_n) - h(x)| > \epsilon, \|x_n - x\| < \delta_\epsilon) \end{aligned}$$

because continuity implies that the second term is zero

$$\begin{aligned}
 &= P(\|h(x_n) - h(x)\| > \varepsilon, \|x_n - x\| \geq \delta_\varepsilon) \\
 &\leq P(\|x_n - x\| \geq \delta_\varepsilon) \\
 &= P(|\text{op}(z)| \geq \delta_\varepsilon)
 \end{aligned}$$

Taking limit yields

$$\begin{aligned}
 \limsup_{n \rightarrow \infty} P(\|h(x_n) - h(x)\| > \varepsilon) &\leq \limsup_{n \rightarrow \infty} P(|\text{op}(z)| \geq \delta_\varepsilon) \\
 &= 0.
 \end{aligned}$$

Theorem 2 :- (iid Weak Law of Large Numbers) Let $\{X_n\}$ be a sequence of iid random vectors such that $E\|X_i\| < \infty$. Then

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{P} EX_i$$

proof: Denote the characteristic function of X_i as $\varphi(t) := E[\exp(jt X_i)]$, where $j = \sqrt{-1}$. Write

$$\begin{aligned}
 \varphi_n(t) &= E \left[\exp \left(\frac{jt}{n} \sum_{i=1}^n X_i \right) \right] \\
 &= E \left[\prod_{i=1}^n \exp \left(\frac{jt}{n} X_i \right) \right] \\
 &= \prod_{i=1}^n E \left[\exp \left(\frac{jt}{n} X_i \right) \right] \\
 &\stackrel{\text{by indep}}{=} \left\{ E \left[\exp \left(\frac{jt}{n} X_i \right) \right] \right\}^n \\
 &\stackrel{\text{by id}}{=} \{\varphi(t/n)\}^n.
 \end{aligned}$$

By a Taylor approximation around $t=0$:

$$\varphi(t/n) = \underbrace{\varphi(0)}_1 + \underbrace{\frac{t'}{n} E[j X_i]}_{=o(\frac{1}{n})} + \underbrace{\frac{o(t)}{n}}_{=o(\frac{1}{n})}$$

Then

$$\begin{aligned}
 \lim_{n \rightarrow \infty} \varphi_n(t) &= \lim_{n \rightarrow \infty} \left\{ 1 + jt' \frac{E[X_i]}{n} + o\left(\frac{1}{n}\right) \right\}^n \\
 &= \exp(jt' E[X_i]).
 \end{aligned}$$

By Levy's continuity theorem we conclude that

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{d} E[X_i] \quad \text{which implies convergence in probability because it's a degenerate distribution.}$$

Theorem 3. - (inid Weak Law of Large Numbers) Suppose that $\{X_n\}$ is a sequence of mean zero random vectors in \mathbb{R}^k such that $E[X_i, e^{X_j, m}] = 0$ for all $i \neq j$, $e \in \{1, 2, \dots, k\}$ and $m \in \{1, 2, \dots, k\}$. Moreover,

$$\frac{1}{n} \max_{1 \leq j \leq n} E \|X_j\|^2 = o(1)$$

Then

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{p} 0.$$

proof: Write

$$\begin{aligned} P\left(\left\|\frac{1}{n} \sum_{i=1}^n X_i\right\| > \varepsilon\right) &\stackrel{\text{Markov ineq}}{\leq} E\left[\left\|\frac{1}{n} \sum_{i=1}^n X_i\right\|^2\right] \frac{1}{\varepsilon^2} \\ &\stackrel{\text{by indep}}{=} E\left[\frac{1}{n^2} \sum_{i=1}^n \|X_i\|^2\right] \frac{1}{\varepsilon^2} \\ &\leq \frac{1}{n^2} n \max_{1 \leq j \leq n} E \|X_j\|^2 \\ &= o(1) \end{aligned}$$

Then the result follows from taking limit as $n \rightarrow \infty$ on both sides.

Theorem 4. - (iid Central Limit) Suppose $\{X_n\}$ are a sequence of iid random vectors such that $E \|X_i\|^2 < \infty$ and $\text{Var}(X_i) = \Sigma$ and non singular. Then,

$$\frac{1}{\sqrt{n}} \sum_{i=1}^n (X_i - E[X_i]) \xrightarrow{d} N(0, \Sigma)$$

proof:

We can use Levy's continuity theorem for the univariate case and use the Cramér-Wold device to extend it to random vectors. I'll omit the details of this proof.

Consistency

(i) Data $\{y_i, x_i'\}$ is iid

(ii) $E x_i u_i = 0$

(iii) $E x_i x_i'$ has full rank n .

Then

$$\hat{\beta}_n = \beta + o_p(\epsilon)$$

Proof:

$$\begin{aligned}
 \hat{\beta}_n &= \beta + \left(\frac{1}{n} \sum_{i=1}^n x_i x_i' \right)^{-1} \frac{1}{n} \sum_{i=1}^n x_i u_i \\
 &= \beta + \left(\frac{1}{n} \sum_{i=1}^n x_i x_i' - E x_i x_i' + E x_i x_i' \right)^{-1} \frac{1}{n} \sum_{i=1}^n (x_i u_i + E x_i u_i - E x_i u_i) \\
 &\stackrel{\text{Theorem 3}}{=} \beta + \left(o_p(\epsilon) + E x_i x_i' \right)^{-1} \left[o_p(\epsilon) + \underbrace{E x_i u_i}_{=0} \right] \\
 &\stackrel{\text{Lemma 4}}{=} \beta + \left[o_p(\epsilon) + (E x_i x_i')^{-1} \right] o_p(\epsilon) \\
 &= \beta + o_p(\epsilon). \quad \blacksquare
 \end{aligned}$$

Asymptotic Normality

(i) Data $\{y_i, x_i'\}$ is iid

(ii) $E x_i u_i = 0$

(iii) $E x_i x_i'$ has full rank n .

(iv) $E x_{ij}^4 < \infty$ for $j=1, \dots, k$.

(v) $E u_i^4 < \infty$

(vi) $\text{Var}(x_i u_i)$ is positive definite

Lemma 5. - Provided (iv) - (vi) hold. Then $\text{Var}(x_i u_i) = O(\epsilon)$.

Proof: $\text{Var}(x_i u_i) = E(u_i^2 x_i x_i')$

$$\begin{aligned}
& \stackrel{\text{Cauchy-Schwarz}}{\leq} \{ E |u_i|^4 E \|x_i x_i' \|^2 \}^{1/2} \\
& \stackrel{\text{Frobenius Norm}}{=} \{ E |u_i|^4 E (\text{tr}(x_i x_i' x_i x_i')) \}^{1/2} \\
& = \{ E |u_i|^4 E (x_i' x_i)^2 \}^{1/2} \\
& = \{ E |u_i|^4 E \left[\sum_{j=1}^n x_{ij}^2 \right]^2 \}^{1/2} \\
& \text{for some constant } C \leq \{ E |u_i|^4 C \max_{1 \leq j \leq n} E [x_{ij}^4] \}^{1/2} \\
& = O(1) \cdot O(1) \\
& = O(1) \quad . \quad \blacksquare
\end{aligned}$$

Now assume all conditions (i) - (vi) hold. Then

$$\sqrt{n}(\hat{\beta}_n - \beta) \xrightarrow{d} N(0, (E x_i x_i')^{-1} \text{Var}(x_i u_i) (E x_i x_i')^{-1})$$

proof:

First, notice that with Lemma 5 and Theorem 4 we have

$$\begin{aligned}
& \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i \xrightarrow{d} N(0, \text{Var}(x_i u_i)) \\
& \text{i.e. } \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i = O_p(1).
\end{aligned}$$

Then, we write

$$\begin{aligned}
\sqrt{n}(\hat{\beta}_n - \beta) &= \left(\frac{1}{n} \sum_{i=1}^n x_i x_i' \right)^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i \\
&= \left[(E x_i x_i')^{-1} + o_p(1) \right] \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i
\end{aligned}$$

$$= (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'}')^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n \mathbf{x}_{i1} u_{ii} + o_p(1) \frac{1}{\sqrt{n}} \sum_{i=1}^n \mathbf{x}_{i1} u_{ii}$$

Theorem 4

$$= (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'}')^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n \mathbf{x}_{i1} u_{ii} + o_p(1) O_p(1)$$

$$= (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'}')^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n \mathbf{x}_{i1} u_{ii} + o_p(1).$$

$$\xrightarrow[d]{} \mathbb{E}(\mathbf{x}_i \mathbf{x}_{i'}')^{-1} N(0, \text{Var}(\mathbf{x}_{i1} u_{ii}))$$

$$= N(0, (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'}')^{-1} \text{Var}(\mathbf{x}_{i1} u_{ii}) \mathbb{E}(\mathbf{x}_i \mathbf{x}_{i'}')^{-1})$$

$$= N(0, V). \blacksquare$$

Estimation of Asymptotic Variance Matrix

Let $\hat{\mathbf{M}}_n = \frac{1}{n} \sum \mathbf{x}_i \mathbf{x}_{i'}'$, $\hat{\mathbf{R}}_n = \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}$, $\hat{u}_i = y_i - \mathbf{x}_i' \hat{\beta}_n$.

We propose the following estimator of the asymptotic variance V :

$$\hat{V}_n = \hat{\mathbf{M}}_n^{-1} \hat{\mathbf{R}}_n \hat{\mathbf{M}}_n^{-1}.$$

First, consider

$$\begin{aligned} \hat{\mathbf{R}}_n &= \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}' \\ &= \frac{1}{n} \sum_{i=1}^n [(\mathbf{y}_i - \mathbf{x}_i' \hat{\beta}_n \pm \mathbf{x}_i' \beta)^2 \mathbf{x}_i \mathbf{x}_{i'}'] \\ &= \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}' + \frac{1}{n} \sum_{i=1}^n [\mathbf{x}_i' (\hat{\beta}_n - \beta)]^2 \mathbf{x}_i \mathbf{x}_{i'}' - \frac{2}{n} \sum_{i=1}^n [\mathbf{x}_i' (\hat{\beta}_n - \beta) \hat{u}_i] \mathbf{x}_i \mathbf{x}_{i'}' \end{aligned}$$

$$= \mathcal{R} + o_p(1) + R_{1n} + R_{2n}$$

Theorem 4

$$\bullet \|R_{2n}\| \leq \frac{1}{n} \sum_{i=1}^n |\mathbf{x}_i' (\hat{\beta}_n - \beta)|^2 \|\mathbf{x}_i\|^2$$

$$\leq \|\hat{\beta}_n - \beta\|^2 \frac{1}{n} \sum_{i=1}^n \|\mathbf{x}_i\|^2 \|\mathbf{x}_i\|^2$$

$$= o_p(1) \frac{1}{n} \sum_{i=1}^n \|\mathbf{x}_i\|^4$$

$$\begin{aligned}
&= o_p(1) \left[E \|x_i\|^4 + o_p(1) \right] \\
&= o_p(1) [O(1) + o_p(1)] \\
&= o_p(1).
\end{aligned}$$

$$\begin{aligned}
\bullet \|R_n\| &\leq \|\beta_n - \beta\| \frac{1}{n} \sum_{i=1}^n |u_i| \|x_i\| \|x_i x_i'\| \\
&\leq \|\beta_n - \beta\| \frac{1}{n} \sum_{i=1}^n |u_i| \|x_i\|^3 \\
&= o_p(1) \left[E |u_i| \|x_i\|^3 + o_p(1) \right] \\
&\leq o_p(1) \left[\left(E |u_i|^2 \|x_i\|^2 \right)^{1/2} \left(E \|x_i\|^4 \right)^{1/2} + o_p(1) \right] \\
&\leq o_p(1) \left[\left(\sqrt{E |u_i|^4 E \|x_i\|^4} \right)^{1/2} \left(E \|x_i\|^4 \right)^{1/2} + o_p(1) \right] \\
&= o_p(1) [O(1) O(1) + o_p(1)] \\
&= o_p(1).
\end{aligned}$$

Putting it all together yields

$$\hat{\Sigma}_n = \Sigma + o_p(1).$$

Finally, write

$$\begin{aligned}
\hat{V}_n &= M_n^{-1} \hat{\Sigma}_n M_n^{-1} \\
&= [(Ex_i x_i')^{-1} + o_p(1)] [\Sigma + o_p(1)] [(Ex_i x_i')^{-1} + o_p(1)] \\
&= (Ex_i x_i')^{-1} \Sigma E(x_i x_i')^{-1} + o_p(1)
\end{aligned}$$

because

$$(Ex_i x_i')^{-1} = O(1)$$

$$\Sigma = O(1) = V + o_p(1).$$

■
